CONCEPT & PLAYER EXPERIENCE

Forest Adventure

Game Design Document | Assignment 8-9 | Draft for review

Serzhan Karishal | github.com/sezhadlaw/ForestAdventure

01 Title and pitch

Forest Adventure is a mobile platformer where a forest hero jumps across platforms, collects every coin, avoids danger and reaches the exit.

02 Genre and platform

Single-player action platformer. Proposed target: Android phones and tablets, landscape orientation. Short levels support quick play sessions.

03 2D or 3D

2D side-view gameplay in Unity with pixel-art characters and forest environments. The player uses movement, jumps and attacks to overcome obstacles.

04 Core loop

Explore > jump > collect > reach the exit. Collect all required coins to unlock progression. Avoid spikes and enemy attacks; health pickups restore lost hearts. Losing all health leads to another attempt.

05 Controls and screens

Gameplay: left thumb joystick moves the hero; right thumb Jump button jumps. A separate Attack button is planned for shooting.
HUD: hearts show health; the coin counter shows collected and required coins; Pause opens the pause overlay.
Pause: Resume continues, Restart reloads the current level, Menu returns to the main menu. Gameplay time stops while paused.
Main menu: Play starts Level1; Quit exits the application.

06 Content scope

Planned scope: 3 levels, 1 playable hero, a patrolling enemy type and a final boss. Interactables: coins, health pickups, spikes, moving platforms and level exits. Difficulty increases through platform spacing and hazard placement.

PRODUCTION & DELIVERY

Build plan

Game Design Document | Assignment 8-9 | Draft for review

Serzhan Karishal | github.com/sezhadlaw/ForestAdventure

07 Art and sound

Pixel-art forest palette with consistent sprite scale and readable UI. Existing project folders include forest backgrounds and tiles; exact asset authors and source links must be confirmed before submission. Planned audio: background music, jump, coin, damage and button sounds, balanced below the music.

08 Minimum viable product - week 15

An Android build with a complete main menu, playable HUD and working pause menu; three completable levels; movement, jumping, coins, hazards, health and enemy encounters; a final win state; sound and saved progress. The HUD must fit a 16:9 phone, a notch phone and a 4:3 tablet.

09 Cut list

No multiplayer, online accounts, open world, crafting, skill tree, procedural levels or in-app purchases. Keep one hero and a small set of enemies to finish the core game reliably.

10 Weekly plan - weeks 9 to 13

Week 9: define the concept, create the repository and prepare the GDD.
Week 10: finish menu, HUD and pause; configure anchors and safe area; check three device shapes.
Week 11: develop enemy patrol and combat; tune damage and boss behaviour.
Week 12: implement saved progression and integrate music and sound effects.
Week 13: add effects, balance all levels, test on Android and fix issues before the final build.

Review before submission: confirm the game title, platform, content counts, asset credits and personal details. This document describes intended scope; it does not certify that features or device tests are complete.
